Executive Summary

Application: banking application
Scenario: unknown
Job ID: JOB-754a9100
Overall Result: FAIL

The performance test shows a critically high error rate (8.00%) far above the acceptable 1.0% threshold, despite healthy CPU, memory, and database metrics from monitoring. Infrastructure appears stable, but there is a significant 153% discrepancy between client-side and infra response times, which may indicate measurement or clock synchronization issues. Immediate attention is needed to analyze and mitigate the high error rate and to investigate the cause of the large response time reporting gap.

Per-API Findings (Test Execution)

- unknown [FAIL / critical]
avg=184.22ms p95=266.85ms max=306.56ms throughput=460.56 req/s error_rate=8.0% http_status=200
* Error rate 8.00% exceeds 1.0% threshold.
history: No historical context available for this API/scenario; relying on static threshold breach (error rate > 1.0%).
recommendation: Investigate recent regressions or changes contributing to the high error rate. Verify application, API logic, and upstream service stability. Consider reviewing alerting and runbook documentation for errors exceeding 1.0%.

Infrastructure Health (Monitoring)

Status: PASS (monitoring_agent reported: unknown)
CPU usage: 61.67% Memory usage: 66.08% DB connections: 151.92 TPS: 156.92 Response time (monitoring): 466.25ms
Cross-check: monitoring_agent's response_time (466.25ms) disagrees with test_execution_agent's avg_response_time (184.22ms) by 153% -- worth checking measurement points/clock sync.

Recommended Next Steps

- unknown: Investigate recent regressions or changes contributing to the high error rate. Verify application, API logic, and upstream service stability. Consider reviewing alerting and runbook documentation for errors exceeding 1.0%.
